Relation Between Features

Model Testing

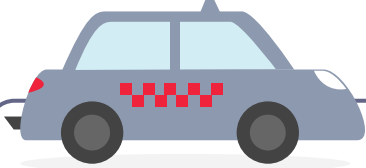

Future Work

# Overview

This project aims to test and validate features which effect the price of the car, based on validating different kind of experiments to finalize the best R square score result.

# Project workflow

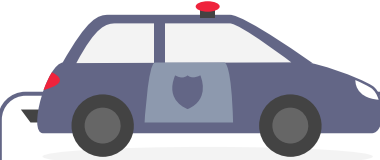

1

Exploring and  
cleaning dataset

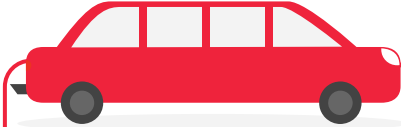

2

Convert categorical  
values into dummy  
variables

3

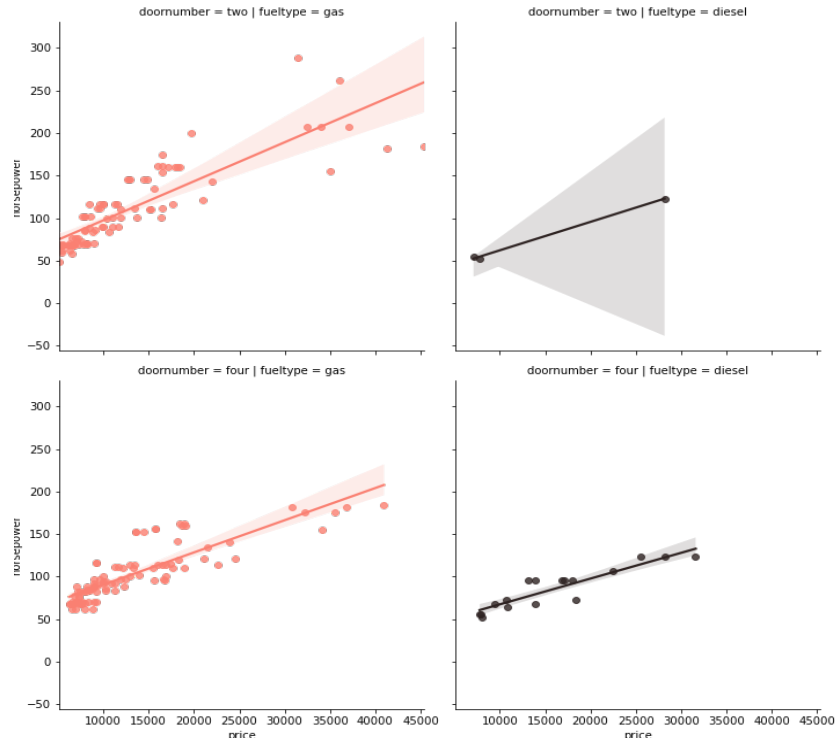

Setting up the model

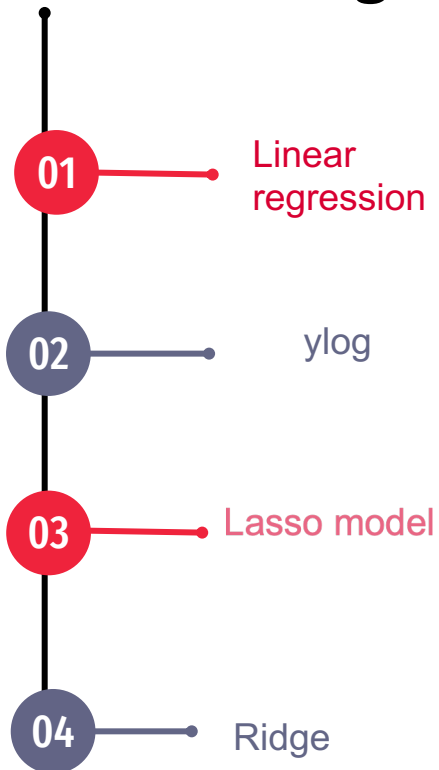

4

Experiments and  
Evaluation

# Relation Between Features

# Model Testing

Training	Validation
0.855	0.851
0.95	0.81
0.91	0.80
0.89	0.75

# Future work

Due to the lack of time we couldn't test and predict our target variable. For future, we will select those feature which contribute the most to the predicted variable and , create machine learning model out of it.

**T**hank you for your listening 😊
